IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

Phase 1: Brainstorming & Ideation

Objective: Identify the employee-data import problem and define the ServiceNow-based data migration idea.

1. Problem Identified

- The project handles structured employee data received in spreadsheet format.
- Employee information needs to be moved into ServiceNow efficiently and accurately.
- Manual entry of bulk employee records can require additional effort and may lead to data-entry errors.
- The project therefore focuses on using ServiceNow Import Sets and Transform Maps for the import process.

2. Proposed Idea

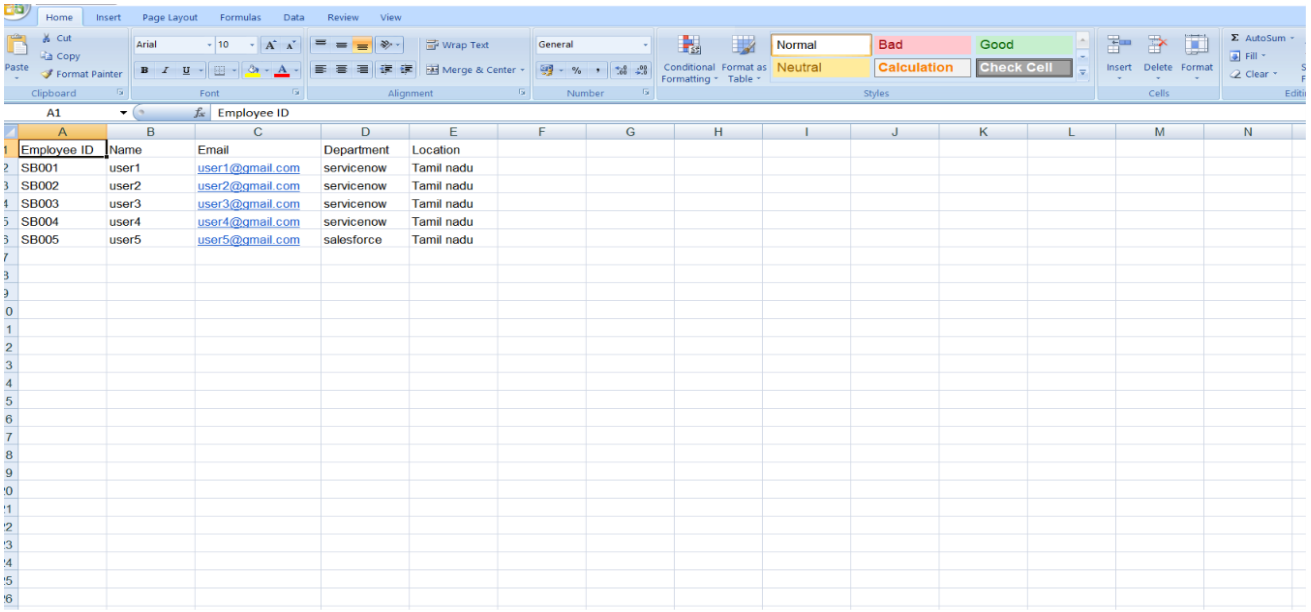

- Prepare sample employee data in a spreadsheet and use it as the external data source.
- Load the spreadsheet into a ServiceNow Import Set table as a staging area.
- Use a Transform Map to map source fields to the appropriate fields in the target Employee Test table.
- Execute the transformation and verify that the employee records are created correctly.

3. Initial Data Import Idea

- Spreadsheet → Employee Import → Transform Map → Employee Test.
- Employee ID, Employee Name, Email, Department and Location are used as employee data fields.
- Transform Map field mapping connects the imported source data with the target table.

4. Expected Benefit

- Reduce manual effort involved in entering employee records.
- Improve consistency and accuracy of employee data migration.
- Provide a clear end-to-end understanding of spreadsheet data loading, field mapping, transformation and validation.

Employee ID	Name	Email	Department	Location
SB001	user1	user1@gmail.com	servicenow	Tamil nadu
SB002	user2	user2@gmail.com	servicenow	Tamil nadu
SB003	user3	user3@gmail.com	servicenow	Tamil nadu
SB004	user4	user4@gmail.com	servicenow	Tamil nadu
SB005	user5	user5@gmail.com	salesforce	Tamil nadu
