IMPORT DATA USING TRANSFORM MAPS (SPREADSHEET)

Phase 3: Project Design

Objective: Design the ServiceNow data structure and transformation flow for importing spreadsheet-based employee data.

1. Data Flow Design

- The project follows the flow: Spreadsheet → Import Set Table → Transform Map → Target Table.
- The Employee Import table acts as the staging area before records are transformed.**2. Target**

Table Design

- Create Employee Test as the target custom table.
- Add Employee ID, Employee Name, Email, Department and Location fields.
- Verify that the fields are displayed on the Employee Test form.

3. Transform Map Design

- Create Sample Spreadsheet Import as the Transform Map.
- Use Employee Import as the Source Table.
- Use Employee Test as the Target Table.
- Use Auto Map Matching Fields and Mapping Assist to connect source and target fields.

4. Duplicate Handling Design

- Use Coalesce on a suitable field map to identify existing employee records.
- Repeated matching records are handled as updates rather than creating duplicate records.
